

HWC4-09-241 Magic-Pak® 9.2 EER Unit Minimum Circuit Ampacity/Fuse Value

Allied Air Enterprises, LLC will have a running change in production in the first Quarter of 2014. We will be transitioning our V-Series™ Magic-Pak equipment from 9.0 EER to 9.2 EER to keep up with new construction minimum efficiency requirements.

With this introduction, one of the units will have an improved Minimum Circuit Ampacity (MCA) and Fuse Value (FV). Knowing the long lead time for most projects, it is critical to get this information out prior to the pending release announcement. The new rating on the HWC4-09-241 unit will be as follows:

| | Current Unit | New Unit |
|---------------------------|--------------|----------|
| Minimum Circuit Ampacity: | 20.6 | 17.8 |
| Maximum Fuse Value: | 30 | 25 |

The remainder of the line will retain the current MCA/FV values. Updated Technical Specification Sheets will be sent out with the formal announcement of the change. If you have any questions, please contact Technical Services at 1-800-515-3501.
