

## Comfort Sync 2.12 Thermostat Update

### What

The 2.12 push will automatically upgrade the firmware on installed and registered thermostats.

### When

It will occur at 4 AM local time on Thursday, December 12, 2013. Download time will be between 5-25 minutes depending on router bandwidth and speed. A pop-up window will notify users that a new upgrade has occurred, and refer them to the [mycomfortsync.com](http://mycomfortsync.com) website for more details.

### How

All Comfort Sync thermostats installed after that date will automatically be upgraded to 2.12 at the time of registration. The download will occur in the background and will not interfere with operation or programming of the thermostat, and will most likely not be noticed.

### Features

- New Away mode button graphic. No functionality differences.
- Ability to toggle the Outdoor temperature display between the Accu-Weather temperature, or the Outdoor sensor temperature (if one is installed. If not installed, the option will not be available.)
